

RECORDING AUDIO FOR PRESENTATIONS

There are a lot of options for recording audio on your PC/Mac for presentations. Let's have a look at some of the best options out there:

Blue Yeti USB Microphone

The Blue Yeti is a very high quality USB microphone with omnidirectional audio capture. At \$120, this is a fantastic microphone for recording anything straight to your PC, i.e. for presentations etc.

It's also a fantastic microphone for doing webinars/voice calls etc.

Logitech ClearChat Comfort USB Headset

The Logitech ClearChat headset is a very inexpensive headset that can be used for simple audio capture of video presentations.

You won't get as clear audio as the Blue Yeti; however you only have to pay \$30 for this headset!

This is a decent choice if you don't want to break the bank and need something to just capture simple audio. Use this in conjunction with my audio clean up techniques, and you will get some decent results.

PRESENTATIONS

The H1 Zoom

The H1 Zoom is a fairly inexpensive professional voice recorder. For just \$99 you can capture high quality audio for your presentation videos. The H1 also has the ability to connect a lavalier microphone which is a great benefit if you want to record audio for camera footage. I have used the H1 on professional jobs many times with some fantastic results.

So the H1 is like a 2 in 1 solution for recording audio for your PC/Mac presentations, as well as camera footage audio. For the price, you can't go wrong.

H4N Zoom & Sony UWP V-1 Combo

My personal setup is made up of 2 devices. I use the H4N Zoom Voice Recorder, along with a Sony UWP V-1 Lavalier microphone system. I use this system because it allows me to record audio for any situation, i.e. Camera footage audio, PC audio etc.

The Sony UWP V-1 is a wireless solution, so it's fantastic for shooting documentary videos/films. This is a very high quality top level setup, and will give you the best audio results you can get at this price range.
